# Transaction-based operations

Transaction-based operations for **Wirecard Checkout Page** and **Wirecard Checkout Seamless** depend on existing orders, i.e. orders which have been completed by the consumers in your online shop and which are at your disposal for further actions.

## Available transaction-based operations

The following transaction-based operations are available:

Operation	Description
approveReversal	For canceling an approval, typically done by your consumer in your online shop.
deposit	For converting an approval into a deposit.
depositReversal	For canceling a deposit.
getOrderDetails	For returning all order details including corresponding payments and credit notes.
recurPayment	For creating a new order based on an existing order, typically used for subscriptions.
refund	For creating a credit note for an order, typically done by the merchant after the consumer returned an ordered product.
refundReversal	For canceling a credit note.
transferFund	For creating a credit note without dependency on an pre-existing payment.

Please be aware that the availability of a transaction-based operation depends on:

- The payment method
- The financial institution
- The current state of the payment/order

You can always get **all currently available transaction-based operations** of a specific order by using the operation **getOrderDetails**.

If you wish to use such transaction-based operations for Wirecard Checkout Page you need to purchase these features which are then enabled for you from our side. If you have any questions please contact our sales teams.

## Transaction-based operations and payment methods

You can find a detailed table displaying all supported payment methods and their corresponding transaction-based operations at transaction-based operations by payment method.

## Order flow diagrams
