Address Verification System (AVS)

If you want to use this feature, please contact our support teams for enabling the additional response parameters for your account.

Parameter	State	Data type	Short description
avsResponseCode	Success	Alphanumeric including special characters with a variable length of up to 5 characters.	Response code of AVS check.
avsResponseMessage	Success	Alphanumeric including special characters with a variable length of up to 256 characters.	Response text of AVS check.
avsProviderResultCode	Success	Alphanumeric including special characters with a variable length of up to 5 characters.	Provider result code of AVS check.
avsProviderResultMessage	Success	Alphanumeric including special characters with a variable length of up to 256 characters.	Provider result text of AVS check.

Please note that the above mentioned response parameters are enabled by default when you use Wirecard Checkout Seamless in your online shop.

Additionally please ensure to use the following request parameters needed for AVS:

- Consumer billing data
 - consumerBillingFirstname
 - consumerBillingLastname
 - consumerBillingAddress1
 - consumerBillingAddress2
 - consumerBillingCity
 - consumerBillingCountry
 - consumerBillingZipCode
 - consumerEmail

Detailed description of parameters

avsResponseCode

The parameter `avsResponseCode` returns the response code of the AVS check.

avsResponseMessage

The parameter `avsResponseMessage` returns the response text of the AVS check.

avsProviderResultCode

The parameter `avsProviderResultCode` returns the result code of the AVS check as sent by the provider, e.g. American Express.

avsProviderResultMessage

The parameter `avsProviderResultMessage` returns the result text of the AVS check as sent by the provider, e.g. American Express.
