Order flow diagram

The following order flow diagram is intended to give an abstract description of the order flow behavior based on **moneta.ru** transactions.

To interpret this diagram, the successful completion of a NEW PAYMENT and the successful completion of a NEW CREDIT in line with the transaction-based operation `transferFund` are assumed. The operation `transferFund` is described in transaction-based operations for Wirecard Checkout Page and Wirecard Checkout Seamless.

For the explanation of the different status descriptions included in this diagram have a look at `payment.{n}.{m}.state`, `order.{n}.state`, and `credit.{n}.state` which are response parameters of the back-end operation `getOrderDetails`.

Please refer to day-end closings and uncaptured approvals for additional details you need to be aware of.
